

Bajaj Finserv Health Limited

OPD Reimbursement Claims Processing

Design Thinking-Led Product Solutioning Case Study

Project boundary

This case study is specific to the BFHL OPD reimbursement claims-processing project executed in 2022 on Salesforce. It is separate from the HCL Salesforce migration project under Vidal Health in 2025.

75	130	30%	Live
Before productivity	Target and achieved	Efficiency improvement	STP / rule engine
claims/day/processor	claims/day/processor	projected and achieved	eligibility, docs, amount, policy, benefit, duplicate checks

Organization	Bajaj Finserv Health Limited
Project year	2022
Source system	Salesforce
Request object	SR / Service Request, considered as a claim
Claim intake channels	Email, App, Portal
Primary users	Claim processors within the OPD reimbursement team
Your role	Led PRS/product requirement specs, stakeholder interviews, form analysis, and floor-level discovery; supported by one reportee
Discovery approach	Visited the call center and sat with claim processing agents to observe the actual workflow

Version 1.0 | Working case-study draft

Contents

- 1. Executive summary

- 3. Design thinking discovery
- 4. Problem statements
- 5. Solution tracks
- 6. Metrics and evidence
- 7. Role and contribution
- 8. Interview-ready narrative
- 9. Non-overclaim rules and source notes

Source discipline

The content in this PDF uses the uploaded workbook 'Claim Processing Project.xlsx' and your subsequent clarifications. Where the workbook gives project metrics or workstream details, they are treated as source evidence. Where you clarified context, year, role, source system, and outcomes, those have been used as user-validated facts.

1. Executive Summary

The BFHL OPD Reimbursement Claims Processing project was a Salesforce-based claims-processing transformation for OPD reimbursement SRs raised through Email, App, and Portal. The project addressed operational friction faced by claim processors, including Excel-led SR handling, fragmented Salesforce screens, duplicate SRs, manual document handling, and manual rule validation.

The design thinking strength of the project was the discovery method: you did not rely only on leadership-level requirement gathering. You went to the call center, sat with OPD claim processors, observed the workflow, and converted operational workarounds into structured product capabilities.

The solution was decomposed into focused tracks: Queue Management, Customer 360 / One View, Duplicate SR Handling, Document Management, and STP / Rule Engine. The program improved processor productivity from 75 claims per day to 130 claims per day. A 30% efficiency improvement was projected and achieved. STP went live. The zero-data-entry approval direction was envisioned during the project and matured into an achieved capability later, after you had moved out of the project.

2. Project Context and Corrected Boundary

Dimension	Confirmed Detail
Project	BFHL OPD Reimbursement - Claims Processing
Year	2022
System	Salesforce
Object	SR / Service Request, to be considered as a claim
Channels	Email, App, Portal
Users	Claim processors within the OPD reimbursement team
Nature of work	Claim-processing productivity, accuracy, queue, document, duplicate, and STP improvement

Dimension	Confirmed Detail
Separate project	Not the HCL Salesforce migration. The HCL Salesforce migration was a Vidal Health project in 2025.

Sharper framing

This was not a simple Salesforce workflow configuration. It was a design-thinking-led claims-processing redesign that converted floor-level processor pain points into queue management, Customer 360, DMS, duplicate handling, and STP capabilities.

3. Design Thinking Discovery

The empathy phase was grounded in direct observation. You went to the call center, sat with claim processing agents, and observed how SRs were searched, opened, validated, documented, and closed. This made the problem real: processors were not merely slow; they were dealing with fragmented tooling and avoidable workflow complexity.

Observed Processor Behavior	Product Insight	Leakage Type
Downloaded SR list into Excel	The queue was not directly actionable inside Salesforce	Time leakage, control leakage
Used SR numbers from Excel to search and process claims	Work discovery was manual	Attention leakage, missed-SR risk
Juggled SR details, search result, and customer details screens	Claim context was fragmented	Decision leakage, time leakage
Handled duplicate SRs manually	System did not recognize claim continuity across channels	Duplicate leakage, data leakage
Referred older SR documents to validate authenticity	Customer and document history were not consolidated	Data leakage, quality risk
Used MS Paint and external tools for image operations	Document operations were outside the claim workflow	Tool-switching leakage
Converted JPEG files to PDF for preview	System behavior did not match real document formats	Manual effort leakage
Manually validated eligibility, amount, policy, benefit, and document rules	Rule intelligence was not embedded into processing	Decision leakage, scalability leakage

Key empathy insight

Claim processors were compensating for workflow fragmentation, document-management gaps, duplicate SR creation, and lack of embedded decision support. The product opportunity was to reduce cognitive load and turn Salesforce into an operational claim-processing cockpit.

4. Problem Statements

The project can be expressed through one core problem statement and five supporting capability-level problem statements.

Core problem statement

OPD reimbursement claim processors needed a consolidated, system-led way to process claims because they were manually managing SR queues, switching across fragmented Salesforce screens, validating documents through external tools, handling duplicate SRs, and manually checking eligibility and claim rules, resulting in lower productivity, higher processing time, and avoidable operational errors.

Area	Problem Statement
Queue Management	Claim processors needed an auto-allocated and prioritized SR queue because they were downloading SR lists into Excel and manually searching claims, resulting in distraction, missed-SR risk, and lower throughput.
Customer 360 / One View	Claim processors needed a single claim-processing view because claim details, customer history, documents, SR list, and decisioning context were scattered across multiple screens, increasing processing time and cognitive load.
Duplicate SR Handling	The OPD team needed duplicate SR detection and merge capability because customers could raise multiple SRs for the same claim through Email, App, and Portal, resulting in duplicate effort, scattered documents, and longer claim closure time.
Document Management	Claim processors needed integrated document management because they were using external tools, manually converting files, uploading documents from email, and checking older SR documents manually, resulting in higher AHT and validation risk.
STP / Rule Engine	The OPD claims team needed configurable STP and rule-engine capability because manual validation of eligibility, document completeness, amount, policy, benefit, and duplicate checks limited scalability and consistency.

5. Solution Tracks

The project was correctly decomposed into focused mini-teams and capability tracks. This reduced execution risk and prevented the product from becoming one large vague claims-processing transformation.

Mini-Team / Track	Owner in Workbook	Key Metric / Focus
Queue Management	Siddharth	TAT 24 hours; deficient claim processing TAT 2 days; deficient clearance rate 80%
1 View / Customer 360	Samadhan	Agent productivity 130 cases/day; decision accuracy 99%; Agent NPS 40
Duplicacy	Tejaswini	Duplicate cases identified; correctness
STP	Vaibhav	STP pass percentage 50%
Document Management	Vishal	OCR accuracy 80%; deficient cases due to blurred documents less than 5%

5.1 Queue Management

Observed Problem	Solution Capability	Expected Design Impact
Agents downloaded SR lists locally and searched SRs manually.	Auto allocation of SRs, round-robin allocation, agent view, escalation routing, priority queues, SLA-driven prioritization.	Move from manual work discovery to a ready-to-use claim pipeline inside Salesforce.
No mechanism for faster service to high-value customers.	Priority processing of SRs and separate queues where required.	Improve service differentiation and reduce avoidable delay for priority cohorts.
Special handling needed for entitled customers and suspected fraud.	Separate queues for GMC entitled customers and suspected fraud.	Reduce processing ambiguity and improve queue-level control.

5.2 Customer 360 / One View

Observed Problem	Solution Capability	Expected Design Impact
Agents juggled SR details, search result, and customer details screens.	Customer 360 with customer details, SR list, SR-wise documents, and decision funnel.	Reduce screen switching and give the processor one decision cockpit.
Important page elements were spread across forms and screens.	Field prioritization and form analysis for one-view layout.	Improve information consumption and reduce cognitive load.
Operations needed traceability.	Audit trail tracking system and user operations on system objects.	Improve controllership and reviewability.
Need to understand effort at granular level.	Track time spent on each field, document, and SR.	Create better productivity and bottleneck visibility.

5.3 Duplicate SR Handling

Observed Problem	Solution Capability	Expected Design Impact
Every customer email created a new SR; customers could raise multiple SRs for the same claim via different modes.	Identify duplicate SRs and sources of duplication.	Reduce duplicate processing and scattered claim context.
Duplicate handling and document validation with older SRs were manual.	Automated or partially automated duplicate handling and document-level comparison.	Reduce process length and increase average cases handled per processor.
Duplicate events needed traceability.	Merge duplicate SRs and show duplicate creation / merge in audit trail.	Improve auditability and operational control.

5.4 Document Management

Observed Problem	Solution Capability	Expected Design Impact
Agents used external tools such as MS Paint and Notepad for document operations.	Central DMS and embedded document operations within the consumer information screen.	Reduce tool switching and manual workarounds.
Documents from email had to be manually downloaded and uploaded into SRs.	Email intent identification and auto document pull into the respective SR.	Reduce manual attachment handling and human-error risk.
JPEG preview issue forced agents to convert files into PDFs.	Advanced document preview and operations: full-size view, zoom, rotate, image preprocessing.	Support actual document behavior without external conversion.
Agents had to check older SR documents to validate authenticity.	Customer-wise and SR-wise document mapping; document compare mechanism.	Improve validation speed and duplicate-document detection.

5.5 STP / Rule Engine

Observed Problem	Solution Capability	Expected Design Impact
Manual rule validation limited productivity and consistency.	Configurable rule engine covering eligibility, document completeness, amount validation, policy rules, benefit rules, duplicate checks, and related validations.	Shift from manual validation to rule-led assisted processing.
Automation needed governance.	Reporting and audit mechanism; false positive and true negative handling logic.	Make STP auditable and safer for claims operations.
Future-state vision required minimal manual entry.	Zero data entry approval process where agent checks and approves.	Create a roadmap from processor-led data entry to system-supported approval.

6. Metrics and Evidence

The strongest impact narrative is the movement in processor productivity. The pre-project baseline was 75 claims/day/processor. The target and achieved state was 130 claims/day/processor. This represents a 73.3% increase in throughput. However, use this carefully: the safer claim is that the overall OPD reimbursement transformation moved productivity from 75 to 130 claims per day, while the program also projected and achieved a 30% efficiency improvement.

75	130	+73.3%	30%
Baseline	Achieved	Throughput change	Efficiency
claims/day/processor	claims/day/processor	from 75 to 130	projected and achieved

Metric	Value / Target	Source / Interpretation
Processor productivity before state	75 claims/day/processor	User clarification
Processor productivity target and achieved	130 claims/day/processor	Workbook metric and user clarification
Efficiency improvement	30%	Workbook impact metric and user clarification that it was projected and achieved
Decision accuracy	99%	Customer 360 metric in workbook
Agent NPS	40	Customer 360 metric in workbook
STP pass percentage	50%	Mini Teams / STP workbook metric
OCR accuracy	80%	Document Management workbook metric
Deficient cases due to blurred documents	Less than 5%	Document Management workbook metric
Deficient claim processing TAT	2 days	Q-Handling workbook metric
Deficient clearance rate	80%	Q-Handling workbook metric

6.1 Duplicate SR Evidence

The workbook contains duplicate-case analysis that supports the duplicate-handling business case. The STP tab shows an increasing duplicate percentage across April, May, and June.

Timeline	Total Cases	Duplicate Cases	Duplicate %
All Time	74,124	11,268	15.2%

Timeline	Total Cases	Duplicate Cases	Duplicate %
April-May-June	36,966	9,213	24.92%
April	8,460	1,654	19.55%
May	11,990	2,892	24.12%
June	16,516	4,667	28.26%

Interpretation

Duplicate SRs were not a minor edge case. The duplicate percentage rose from 19.55% in April to 28.26% in June, indicating a growing operational drag and a strong business case for duplicate detection, source-level prevention, merge capability, and audit trail visibility.

7. Your Role and Contribution

Your role should be positioned as product discovery and solutioning leadership, not just requirement documentation. The strongest evidence is that you directly observed the operating users and translated pain points into product capability tracks.

Contribution Area	Your Contribution
Discovery	Visited the call center, sat with claim processing agents, observed SR handling and real workarounds.
Stakeholder management	Interviewed stakeholders and validated workflow issues across processor and operational contexts.
Product artifacts	Created PRS/product requirement specs, user journeys, and form analysis.
Solutioning	Helped shape Customer 360, queue management, document management, duplicate handling, STP, and zero-data-entry approval direction.
Team support	Was supported by one reportee during discovery and requirements work.
Strategic direction	Defined the zero-data-entry approval direction; it was achieved later, after you had moved out of the project.

Precise role statement

Led product discovery and solutioning for BFHL OPD reimbursement claims-processing transformation on Salesforce, supported by one reportee. Conducted floor-level discovery with claim processors, mapped workflow fragmentation, duplicate handling, document management, and rule-validation gaps, and converted these insights into PRS, user journeys, form analysis, and phased product capabilities.

8. Interview-Ready Narrative

Use this version in interviews, promotion discussions, portfolio documents, or leadership storytelling.

Narrative

In 2022, I led product discovery and solutioning for BFHL's OPD Reimbursement Claims Processing project on Salesforce. The objective was to improve claim processor productivity, reduce manual effort, and move the workflow toward rule-led assisted processing.

I did not start with a feature backlog. I went to the call center, sat with OPD claim processors, observed how they handled SRs, and identified the actual friction points. Processors were downloading SR lists into Excel, manually searching claims, switching across multiple Salesforce screens, handling duplicate SRs from Email, App, and Portal, using external tools for document operations, and manually validating eligibility and claim rules.

Based on this discovery, we structured the solution into focused capability tracks: Queue Management, Customer 360, Duplicate SR Handling, Document Management, and STP through a configurable rule engine. I owned the product requirements, user journeys, form analysis, and solutioning, supported by one reportee.

The program improved processor productivity from 75 claims per day to 130 claims per day. We projected and achieved 30% efficiency improvement. The STP rule engine went live, covering eligibility, document completeness, amount validation, policy rules, benefit rules, and duplicate checks. We also defined the zero-data-entry approval roadmap, where agents would only check and approve system-supported decisions. That future state was achieved later, after I had moved out of the project.

9. Non-Overclaim Rules and Source Notes

Topic	How to Phrase It
Zero data entry approval	Say: I envisioned and defined the direction; the capability matured and was achieved later after I had moved out. Do not say you personally delivered the final achieved state.
Productivity movement	Say: the broader OPD reimbursement transformation moved productivity from 75 to 130 claims/day/processor. Do not attribute the entire productivity movement to Customer 360 alone unless isolated data exists.
STP	Say: STP went live and covered eligibility, document completeness, amount validation, policy rules, benefit rules, duplicate checks, and related validations.
HCL / Vidal migration	Keep separate. This BFHL OPD Reimbursement project was in 2022. HCL Salesforce migration was a separate Vidal Health project in 2025.
Discovery credibility	Emphasize direct floor observation with claim processors because this is the strongest design-thinking proof point.

Final One-Line Framing

One-liner

Led design-thinking-led transformation of BFHL OPD reimbursement claims processing by observing claim processors on the floor, identifying workflow fragmentation, duplicate SR creation, document-handling gaps, and manual rule-validation effort, then converting these insights into Salesforce-based Customer 360, queue management, DMS, duplicate handling, and STP capabilities that improved productivity from 75 to 130 claims per day.
