

BFHL Partner Center

Design Thinking-Led Product Case Study

Provider Portal Revamp | HealthPay | 2023

Project Positioning	
Partner Center transformed the earlier Provider Portal into a unified partner operating platform across HealthPay, Labs/Lab Connect, Hospitals, Help & Support, Analytics, and Access Control.	
Dimension	Confirmed Detail
Year	2023
Business Unit	HealthPay
Sequence	After HealthPay Recon & Settlement Automation
Earlier Name	Provider Portal
Final Name	Partner Center
Reason for Rename	Complete revamp of the portal and operating model
Role	Lead Product Manager for the entire Partner Center initiative
PM Support	Maaz Modak and Abhishek Behera
Primary Success Metric	Partner Adoption
Quantified Before/After Metrics	Not available; document avoids invented numeric improvement claims

17. 17. Final One-Line Framing

1. Executive Summary

Partner Center was a 2023 HealthPay initiative that revamped the earlier Provider Portal into a unified partner operating platform. The project was designed for BFHL partners such as labs, diagnostic centers, hospital partners, and HealthPay merchants who needed self-serve access to transactions, settlements, appointments, report upload, support queries, hospital leads, claim assistance, QR/payment workflows, and partner-level visibility.

As Lead Product Manager, Samadhan owned the full Partner Center initiative across roadmap, user stories, stakeholder alignment, GTM/adoption, dashboarding, access control, and delivery. Maaz Modak and Abhishek Behera supported as PMs.

The project delivered Partner Center capabilities across HealthPay, Labs/Lab Connect, Hospitals, Help & Support, Analytics, and Access Control. Partner Adoption was the primary success metric. The project reduced RM/support dependency, improved partner trust and retention, and supported HealthPay transaction adoption. No before/after numeric metrics are available; therefore, this document deliberately avoids unsupported percentage or numeric impact claims.

Core Product Thesis

The real problem was not that partners needed a portal. The real problem was that partners needed an operating center that reduced dependence on RMs, WhatsApp follow-ups, manual support, and internal operations teams.

2. Project Context and Source Basis

The project was executed under HealthPay in 2023, after the HealthPay Recon & Settlement Automation project. The earlier Provider Portal was completely revamped and renamed Partner Center. The rename should be positioned as a result of the full revamp, not merely because the scope expanded beyond providers.

Source Artifact	What It Establishes
Partner Center Review 2 Aug.pptx	Roadmap, adoption data, live/WIP/upcoming capability cohorts, provider feedback, phlebo journey insights, and story backlog.
User Manual - Partner Centre.docx	User-facing login, BajajPay, Orders, Settlements, filters, search, and download/export behavior.
Partner Center User Stories Collection	User-story backbone for Partner Center capability delivery.
Provider Portal V2 Tracker	Tracker-level implementation and delivery context for the portal revamp.
User confirmations in this conversation	Final ownership, scope, go-live status, success metric, and impact positioning.

3. Strategic Framing

A weak framing would be: Built a provider portal. That underplays the actual product complexity.

The stronger and more accurate framing is: Led the 2023 HealthPay Partner Center revamp as Lead PM, transforming the earlier Provider Portal into a unified self-serve partner operating platform across HealthPay, Labs, Hospitals, Help & Support, Analytics, and Access Control.

The product moved partner operations from fragmented RM/support/manual follow-up flows into a self-serve platform where partners could view and act on transactions, settlements, appointments, report uploads, leads, support tickets, QR/payment workflows, and partner-level information.

From	To
------	----

Provider Portal as a narrow access layer	Partner Center as a unified partner operating platform
RM/support dependency	Self-serve transaction, settlement, appointment, and support visibility
WhatsApp and manual follow-up	Structured queues, actions, downloads, and status views
One-size-fits-all partner login	Access control, hierarchy, and partner-specific visibility
Disconnected partner journeys	Cohort-based platform across HealthPay, Labs, Hospitals, and Horizontal services

4. Core Design Thinking Insight

The central design-thinking insight was that BFHL partners did not simply need a login. They needed operational autonomy.

HealthPay partners needed order and settlement visibility. Labs needed appointment and report-upload workflows. Hospitals needed lead and claim-assistance flows. BFHL sales and operations teams needed adoption, support, dashboarding, and access-control visibility.

Design Reframe

From provider portal to partner operating center.

This reframe mattered because the product was not just a UI revamp. It was an operating-model redesign for how partners interacted with BFHL products and workflows.

5. Business Objectives and Success Metrics

Objective		Explanation
Improve Partner Adoption		Make partners actively use Partner Center for their operational workflows instead of relying on RM/support channels.
Reduce RM/Support Dependency		Move repeated information requests and operational actions into self-serve flows.
Improve Transaction and Settlement Visibility		Give HealthPay partners transparent access to orders, settlements, QR filters, payment modes, and downloads.
Improve Partner Trust and Retention		Build reliability through transparent data, workflows, and self-service.
Support HealthPay GMV / Transaction Adoption		Enable partner-side operational readiness for HealthPay usage and collection journeys.
Create Unified Future Platform		Build a platform foundation for HealthPay, Lab Connect, Hospitals, Help & Support, Analytics, Unified Ledger, and Reconciliation Aggregation.
Metric Type	Metric	Status
Primary	Partner Adoption	Confirmed primary success metric
Secondary	Active usage	Tracked directionally; no before/after number available
Secondary	Transaction visibility	Improved through Orders and Settlements views
Secondary	Support case reduction / RM dependency reduction	Improved directionally; no numeric baseline available
Secondary	Provider trust / retention	Improved directionally

Secondary	HealthPay GMV / transaction adoption	Supported by platform adoption and HealthPay visibility
-----------	--------------------------------------	---

6. Stakeholders and User Groups

User Group	Need / Job-to-be-Done
HealthPay Merchants / Diagnostic Partners	View orders, transactions, settlements, QR-level collections, payment status, and downloadable reports.
Lab / Lab Connect Users	View appointments, accept/decline appointments, upload reports, export appointments, and manage center-level data.
Hospital Partners	View and act on hospital leads, claim assistance workflows, and future hospital appointment/settlement journeys.
Partner Admins / Center Managers	Manage users, center-level visibility, access hierarchy, and role-based operational access.
BFHL RMs / Sales Teams	Drive adoption, reduce repetitive support requests, and track partner readiness.
BFHL Operations / Support Teams	Handle Help & Support SRs, partner issues, and operational escalations in a structured way.
Product / Business Leadership	Monitor adoption, feature usage, partner activity, roadmap progress, and platform scalability.

7. Discovery Inputs and Empathy Signals

The Partner Center documents show three strong design-thinking discovery streams: adoption data, Voice of Providers, and phlebo journey discovery.

7.1 Adoption Data

The Partner Center review deck captured partner adoption across HealthPay partners and identified real-world usage issues, including shared login behavior. One specific issue noted was a single user ID being used by multiple users, including Krsnaa usage where one ID was being used by five users.

Discovery Signal	Product Implication
Users existed, but active usage varied	Partner adoption had to become the primary metric rather than just user creation.
Shared IDs were being used	Access control, hierarchy, and user-level accountability were required.
HealthPay partners were live across multiple diagnostic networks	The platform needed to support multi-partner and multi-center scalability.

7.2 Voice of Providers

The Voice of Providers section captured requirements from partners such as Krsnaa, PH, Yoda, and ActivRx. These included QR softcopy generation, dynamic payment link, appointment fields, admin/center-level access, report-upload enhancements, appointment export, Help & Support ticket creation, login optimization, and data-export behavior updates.

Requirement Theme	Examples from Provider Feedback
HealthPay / QR	QR softcopy generation, dynamic payment link from portal, mobile-number change mechanism.

Lab Connect	Customer DOB, center name, appointment filters, appointment export, report upload enhancement.
Access Control	Admin and center-level access, hierarchy, user permissions.
Support	Help & Support functionality to raise tickets for faster issue resolution.
Adoption / Cross-sell	Make Lab Connect available wherever HealthPay is live.

7.3 Phlebo Journey Discovery

The phlebo journey notes showed that center-wise QR codes were used by labs, payment confirmation and reconciliation were being done centrally over WhatsApp, POS machines were not used by phlebos, and field collections relied on cash and UPI. This validated the need for QR-level tracking, dynamic payment link/QR, and transaction visibility.

Field Observation	Product Need
Center-wise QR codes used by labs	QR-level filters, QR download, QR softcopy generation, store/center mapping.
Payment confirmation and reconciliation done over WhatsApp	Self-serve transaction and settlement visibility.
No POS usage by phlebos	Support UPI/QR/payment-link field collection journeys.
Meaningful business came through phlebo journeys	Partner Center needed to support field workflows, not only center walk-ins.

8. Problem Statements

Level	Problem Statement
Core Platform	BFHL partners needed a unified, self-serve operating platform because HealthPay transactions, settlements, lab appointments, report uploads, hospital leads, QR/payment workflows, help/support queries, and partner-level visibility were fragmented across manual follow-ups, RM dependency, WhatsApp coordination, and internal systems.
HealthPay Partner	HealthPay partners needed transaction and settlement visibility, QR/store filters, downloadable data, and payment-link capabilities because they needed to reconcile collections, track store/QR performance, and reduce dependence on central support.
Lab Partner	Lab users needed appointment visibility, accept/decline actions, report upload, reschedule capability, and appointment-level filters because appointment handling was operationally time-sensitive and center-specific.
Hospital Partner	Hospital partners needed lead visibility, lead actions, claim assistance, and hospital appointment workflows because they needed a structured way to act on BFHL-generated opportunities and service requests.
RM / Sales	RMs needed partners to adopt a self-serve platform because repeated operational requests consumed relationship bandwidth and slowed HealthPay adoption.
Support / Operations	Support teams needed Help & Support ticketing and partner query tracking because partner issues were otherwise handled through fragmented calls, WhatsApp, and manual escalation.

9. As-Is Pain Points

Pain Area	Observed / Inferred Pain	Design Response
Transaction Visibility	Partners depended on BFHL teams for order and settlement data.	Orders, Settlements, filters, search, download/export.
Settlement Transparency	Settlement information was not sufficiently self-serve for partners.	Settlement view, settlement-to-transaction drilldown, status filters.
QR/Payment Operations	QR and payment-link workflows were operationally important, especially for phlebo and field payments.	QR view/download, QR/store filters, dynamic QR/payment-link roadmap.
Lab Appointment Operations	Labs needed to see, accept/decline, and act on appointments.	Appointment visibility, notifications, accept/decline, reschedule, report upload.
Report Upload	Partners needed to upload reports against appointments.	Report upload capability and report-upload enhancement.
Hospital Leads	Hospital partners needed visibility and actionability on leads and claim-assistance workflows.	Lead management, lead actions, claim assistance MVP.
Support Dependency	Partner support was dependent on RMs/manual escalation.	Help & Support SR creation and management.
Access Control	Shared logins reduced user accountability.	Admin/center hierarchy, superuser role, access control.

10. Product Strategy and Platform Architecture

The product was structured as a cohort-based platform, not a single-purpose portal. This was the right structure because partner needs varied across HealthPay, Labs, Hospitals, and horizontal services.

Platform Cohort	Strategic Purpose
HealthPay	Give partners self-serve visibility into transactions, settlements, QR/store-level collections, and HealthPay payment workflows.
Labs / Lab Connect	Enable appointment operations, report upload, appointment export, center-level access, and lab settlements.
Hospitals	Enable hospital lead management, claim assistance, hospital appointments, and future hospital settlements.
Help & Support	Create structured support ticketing and reduce RM/manual support dependency.
Analytics / Reporting	Provide adoption, transaction, settlement, appointment, lead, and support visibility.
Access Control	Support partner hierarchy, superuser roles, admin/center-level access, and secure visibility.

11. Delivered Capability Tracks

11.1 HealthPay Orders and Settlements

HealthPay Orders and Settlements went live and became the core transaction-visibility layer for partners. The Partner Centre user manual confirms user-facing BajajPay navigation, Orders view, Settlements view, date-range filters, settlement status filters, payment-mode filters, QR-name filters, order-ID search, and download/export functionality.

Capability	Description
Orders view	Partners could see transaction-level order records.
Settlements view	Partners could see consolidated settlement amount for selected dates.
Transaction detail view	Detailed view of HealthPay transactions.
Settlement-to-transaction drilldown	Ability to understand settlement composition.
Filters	Date range, settlement status, mode of payment, QR name, store/QR filters.
Search	Order ID based search.
Download/export	Data export capability for partner use.

11.2 Lab Appointment Management

Lab Appointment Management went live, including partner-side appointment visibility, accept/decline actions, appointment notifications, and report upload. Later enhancement areas included data export, mobile number visibility, appointment reschedule, report-upload-completed identifier, and lab settlement/invoice upload journey.

Capability	Delivered / Platform Role
Appointment visibility	Partners could see appointment requests.
Accept/decline appointment	Partners could take action on appointments from the portal.
Appointment notification	Portal-based notification for appointments.
Report upload	Partners could upload reports against appointments.
Appointment export	Supported reporting and operational use.
Admin/center access	Supported partner hierarchy and center-level operations.

11.3 Hospital Lead Management and Claim Assistance

Hospital Lead Management and Claim Assistance went live. The roadmap and backlog showed hospital lead visibility, lead detail view, lead actions, lead workflow, lead status, search, filters/sort, bulk actions, claim assistance MVP, and future hospital appointment and settlement workflows.

Capability	Platform Role
Lead visibility	Allow hospitals to view BFHL-generated opportunities.
Lead action/status	Allow hospital partners to act on and update leads.
Lead detailed view	Provide full context for action.
Filters, search, sort	Enable operational use at partner side.
Claim Assistance	Enable claim-assistance workflow for hospital partners.
Future hospital workflows	Hospital appointment, hospital payout/settlement, HMIS integration.

11.4 Help & Support

Help & Support SR creation went live and was one of the key horizontal capabilities. This reduced partner reliance on RMs and informal support channels by providing a structured way to raise and manage partner queries.

Capability	Platform Role
Basic Help & Support	Provide partner-facing support entry point.
SR creation	Allow partners to raise support tickets.
Active query visibility	Show currently open/active partner queries.

Closed query visibility	Provide historical support context.
Raise-a-query CTA	Make support discoverable and actionable.

11.5 Access Control and User Hierarchy

Access Control went live and was critical because adoption data showed shared login behavior. Partner Center needed admin, center-level, superuser, and role-based access capabilities to support partner organizations rather than only individual users.

Capability	Reason
Admin and center-level access	Partners operated through multiple centers and teams.
Superuser role	BFHL/partner admins needed broader visibility and support capability.
Access control by business need	Users needed data visibility according to mapped products and centers.
User profile	Enable partner identity and account visibility.
User engagement/adoption tracking	Support Partner Adoption as primary metric.

11.6 Analytics and Dashboarding

Analytics and dashboarding were owned as part of the project scope. Dashboarding was required for partner adoption, transactions, settlements, appointments, leads, and support visibility. Daily trackers were also referenced as part of Partner Center governance.

Dashboard / Reporting Area	Purpose
Partner adoption	Track onboarding, users created, active users, and transacting partners.
HealthPay transactions	Track order and transaction visibility.
Settlements	Track settlement amounts and status.
Appointments	Track lab appointment operations.
Leads	Track hospital lead funnel and actions.
Support	Track partner query creation and closure.

12. Roadmap and Future Platform Vision

Partner Center was intended to become a unified platform across HealthPay, Lab Connect, Hospitals, and partner services. The future roadmap included Unified Ledger and Reconciliation Aggregation.

Roadmap Theme	Future Direction
Dynamic QR / Payment Link	Support field and phlebo journeys with dynamic payment collection mechanisms.
Provider-Initiated Health Plan Consumption	Allow partners to initiate eligible health-plan consumption flows.
Lab Catalogue Management	Enable labs to manage catalogue and center-level offerings.
Center Management and Listing	Support multi-center partner structures.
Hospital Appointment Management	Extend platform depth into hospital appointment workflows.
On-Demand Settlement	Support partner-side settlement request models.
Unified Ledger	Create a consolidated financial view for partners.
Reconciliation Aggregation	Bring payment/recon visibility into Partner Center future state.

13. Design Thinking Process

Stage	Application in Partner Center
Empathize	Used adoption data, Voice of Providers, phlebo journey findings, RM/support dependency, and partner workflow requirements to understand real partner pain.
Define	Reframed the problem from provider portal to partner operating center, with partner adoption as the primary success metric.
Ideate	Structured the platform into HealthPay, Labs, Hospitals, Help & Support, Analytics, and Access Control cohorts.
Prototype / Product Definition	Converted requirements into roadmap, user stories, dashboards, access-control structures, portal views, and feature-level delivery tracks.
Deliver	Delivered HealthPay Orders/Settlements, Lab Appointment Management, report upload, Help & Support SR creation, Hospital Lead Management, Claim Assistance, access control, and dashboarding.
Scale	Defined future platform direction across Unified Ledger, Reconciliation Aggregation, dynamic QR/payment links, advanced help/support, and cross-product partner services.

14. Your Role and Ownership

Samadhan was Lead Product Manager for the complete Partner Center project. Maaz Modak and Abhishek Behera supported as PMs.

Ownership Area	Details
Product Leadership	Owned the complete Partner Center initiative across cohorts.
Roadmap	Owned roadmap across HealthPay, Labs/Lab Connect, Hospitals, Help & Support, Analytics, and Access Control.
User Stories	Owned user-story definition and prioritization.
Stakeholder Alignment	Aligned partners, business, operations, sales/RM teams, and technology stakeholders.
GTM / Adoption	Owned GTM and partner-adoption focus.
Dashboarding	Owned dashboard and reporting direction.
Delivery	Owned delivery of all planned/live capabilities under the Partner Center scope.

15. Impact and Outcome

The project delivered a full Partner Center revamp and moved the platform beyond the earlier Provider Portal model. Since before/after numeric metrics are not available, the impact should be stated directionally and precisely.

Impact Area	Supported Statement
Partner Adoption	Partner Adoption was the primary success metric and the platform was designed around partner activation and active usage.
RM/Support Dependency	Reduced dependence on RMs and support teams by moving

	transactions, settlements, appointment actions, report upload, and support tickets into self-serve flows.
Partner Trust / Retention	Improved trust through transparency in orders, settlements, appointments, leads, and support.
HealthPay Transaction Adoption	Supported HealthPay GMV/transaction adoption through QR/payment workflow visibility, partner training, and self-serve transaction/settlement access.
Operational Scalability	Enabled multi-cohort platform scale across HealthPay, Labs, Hospitals, Help & Support, Analytics, and Access Control.
Future Readiness	Created foundation for Unified Ledger, Reconciliation Aggregation, dynamic QR/payment link, and advanced partner services.

Honest Impact Boundary

No before/after numerical metrics are available. The document therefore uses directional impact statements such as reduced RM/support dependency, improved partner trust, and supported HealthPay transaction adoption instead of invented percentages.

16. Interview and Resume Narrative

16.1 Interview-Ready Narrative

In 2023, after the HealthPay Recon project, I led the complete revamp of BFHL's Provider Portal under HealthPay, which was renamed Partner Center. The rename was not just cosmetic; it reflected a full product revamp into a more structured partner operating platform.

The problem was that BFHL partners - labs, hospitals, diagnostic partners, and HealthPay merchants - were dependent on RMs, support teams, WhatsApp, emails, and internal operations teams for basic visibility and actions. They needed a self-serve platform for transactions, settlements, appointments, report uploads, leads, support tickets, QR/payment workflows, analytics, and access control.

As Lead PM, I owned the full Partner Center roadmap, user stories, stakeholder alignment, dashboarding, GTM/adoption, and delivery. I was supported by Maaz Modak and Abhishek Behera. We structured the platform across HealthPay, Labs/Lab Connect, Hospitals, Help & Support, Analytics, and Access Control.

The delivered platform included HealthPay Orders and Settlements, Lab Appointment Management, partner report upload, Help & Support SR creation, Hospital Lead Management, Claim Assistance, access control, and dashboarding. Partner Adoption was the primary success metric. The project reduced RM/support dependency, improved partner trust, and supported HealthPay transaction adoption. We also defined the future platform direction around Unified Ledger and Reconciliation Aggregation.

16.2 Resume Bullet

Resume Bullet

Led the 2023 HealthPay Partner Center revamp as Lead PM, transforming the earlier Provider Portal into a unified self-serve partner platform across HealthPay, Labs, Hospitals, Help & Support, Analytics, and Access Control; delivered HealthPay Orders/Settlements, Lab Appointment Management, report upload, Help & Support SR creation, Hospital Lead Management, Claim Assistance, access controls, and dashboarding, improving partner adoption, reducing RM/support dependency, and supporting HealthPay transaction growth.

16.3 Portfolio Summary

Led BFHL's 2023 Partner Center revamp under HealthPay, converting the earlier Provider Portal into a unified partner operating platform. Owned the full roadmap, user stories, stakeholder alignment, GTM/adoption, dashboarding, and delivery with support from two PMs. Delivered partner-facing capabilities across HealthPay transactions and settlements, lab appointments, report uploads, hospital lead management, claim assistance, Help & Support SR creation, access control, and analytics. Partner Adoption was the primary metric, with the platform reducing RM/support dependency, improving partner trust, and supporting HealthPay transaction adoption.

17. Final One-Line Framing

Final Framing

Partner Center transformed BFHL's earlier Provider Portal into a unified partner operating platform that enabled self-serve transaction visibility, settlement visibility, appointment management, report upload, hospital lead management, claim assistance, support ticketing, access control, and analytics across the HealthPay partner ecosystem.

Appendix: Source Notes

This document is based on the uploaded Partner Center Review deck, Partner Centre user manual, Partner Center user-story collection, Provider Portal V2 tracker, and user-confirmed project context in this conversation. Source artifacts establish the cohort roadmap, live feature lists, user-facing Orders/Settlements behavior, provider feedback, phlebo journey insights, and delivery context.

Where quantitative before/after metrics were unavailable, the document avoids unsupported numerical claims.
