

BFHL Service Guarantee

Design Thinking-Led Product Case Study

Lab Test Booking and Doctor Appointment Fulfilment | BFHL | 2022

Attribute	Detail
Organization	Bajaj Finserv Health Limited
Project	Service Guarantee
Scope	Lab test booking fulfilment and doctor appointment fulfilment
Primary Systems	SFDC, HRx, app/web, communication workflows
Role	Lead Product Manager
Delivery Status	Complete Service Guarantee flow went live

"The core product shift was from booking creation to fulfilment assurance: ensuring the service actually happened, not merely that a booking existed."

1. Executive Summary

The Service Guarantee project was a 2022 BFHL initiative executed immediately after the OPD Reimbursement Claims Processing project. The project focused on improving fulfilment assurance for lab test bookings and doctor appointments.

The core problem was not booking creation. Customers were already able to initiate bookings through digital channels. The real problem was that a booking did not guarantee successful fulfilment. Provider confirmation, appointment completion, customer communication, rescheduling, rejection handling, and escalation were fragmented across systems and operational teams.

As Lead Product Manager, Samadhan owned the complete Service Guarantee initiative. The solution converted a fragmented fulfilment process into a structured SFDC-led service assurance workflow, integrated with HRx, customer-facing app/web status visibility, automated WhatsApp/SMS/voice-blast communication, provider confirmation workflows, agent queues, and TAT-based escalation.

The complete Service Guarantee flow went live. Fulfilment Rate was the primary success metric. Customer complaints reduced significantly after rollout, and the initiative improved customer trust and provider accountability.

2. Project Context

Attribute	Detail
Organization	Bajaj Finserv Health Limited
Project	Service Guarantee
Year	2022
Timing	Immediately after BFHL OPD Reimbursement Claims Processing
Scope	Lab test booking fulfilment and doctor appointment fulfilment
Primary System	Salesforce / SFDC
Integrated System	HRx
Customer-Facing Channels	App / Web
Communication Channels	WhatsApp, SMS, Voice Blast
Primary Metric	Fulfilment Rate
Secondary Metrics	Confirmation TAT, appointment completion, complaints, provider response, SLA adherence
Role	Lead Product Manager for the entire project
Team Support	Junior Product Managers
Delivery Status	Complete Service Guarantee flow went live
ProviderRx	Separate/dependent track; deprioritized

3. Strategic Framing

The Service Guarantee project should not be positioned as a simple case-management or appointment-management project.

Weak Framing	Stronger Framing
Built SFDC case management for lab and doctor appointments.	Led BFHL's Service Guarantee initiative for lab test and doctor appointment fulfilment, converting fragmented booking follow-ups into a structured SFDC-led fulfilment assurance workflow with HRx integration, app-facing status visibility, automated WhatsApp/SMS/voice-blast communication, provider confirmation tracking, TAT-based escalation, and operational case visibility.

The project's real value was in transforming the operating model from manual follow-up and customer uncertainty to system-led fulfilment assurance.

Before	After
Booking raised -> manual provider follow-up -> customer uncertainty -> complaint or escalation	Booking raised -> SFDC case created -> provider confirmation tracked -> customer updated -> SLA monitored -> escalation triggered -> service fulfilled or recovered

4. Core Design Thinking Insight

"Customers do not only want to book a service. They want assurance that the service will actually happen."

For the customer, the booking journey is incomplete until:

1. The provider confirms the appointment.
2. The appointment or lab test happens as scheduled.
3. The customer receives timely updates.
4. The customer has visibility in the app.
5. Rejection or no-response cases are recovered.
6. The service is closed only after fulfilment.

The product problem was therefore reframed from booking management to fulfilment assurance. This reframing was critical. Without it, the solution would have remained limited to appointment creation. With this reframing, the solution expanded to provider accountability, communication automation, SLA tracking, escalation, and end-to-end service visibility.

5. Business Objective

5.1 Improve Customer Trust

Customers needed confidence that BFHL would not merely take a booking request but would actively ensure that the appointment or lab test was fulfilled.

- App-facing status visibility
- Timely WhatsApp and SMS updates
- Voice-blast reminders and escalations
- Provider confirmation tracking
- Recovery flows for rejection or no-response scenarios
- TAT-based operational ownership

5.2 Improve Provider Accountability

The service experience depended heavily on providers, labs, and doctors confirming and honouring appointments. Without structured provider tracking, poor provider behaviour could damage customer experience.

- Provider response tracking
- Accept, reject, and reschedule states
- No-response escalation
- Agent action queues
- SLA/TAT monitoring
- Structured operational visibility

6. Primary and Secondary Success Metrics

Metric	Role in the Project
Fulfilment Rate	Primary success metric; measures whether the booked service was actually completed.
Provider Confirmation TAT	Measures speed of provider response.
Appointment Completion Rate	Measures whether confirmed bookings resulted in completed services.
Customer Complaints	Measures reduction in broken journeys and trust gaps.
Provider Response Rate	Measures provider accountability.
SLA/TAT Adherence	Measures operational discipline.
Reschedule/Rejection Handling	Measures recovery effectiveness.
App-Visible Status Accuracy	Measures customer transparency.
Agent Queue Ageing	Measures operational control and backlog health.

"Before/after numerical values are not available, so quantified claims should be avoided. The correct impact statement is: customer complaints reduced significantly after rollout."

7. Stakeholders and Users

User / Stakeholder	Need
Customer	Confidence that the booked service will happen.
Fulfilment Agent	Actionable case queues and next-best actions.
Provider / Lab / Doctor	Ability to confirm, reject, or reschedule appointment requests.
Team Lead / Operations	Visibility into ageing, SLA breaches, and escalations.
Business Team	Improved fulfilment rate and reduced customer complaints.
Product / Technology Team	Integrated workflow across SFDC, HRx, app/web, and communication systems.

8. Design Thinking-Led Discovery

8.1 Customer-Side Discovery

Customers were able to initiate bookings, but the post-booking journey needed assurance. The customer needed to know:

- Has my booking been received?
- Has the provider accepted it?
- Is the appointment confirmed?
- What happens if the provider rejects it?
- Can I reschedule?
- Will I receive reminders?
- Will I know if the appointment is completed?
- What happens if I do not receive the expected service?

8.2 Agent-Side Discovery

Agents needed a workflow that told them exactly which cases required action. They needed visibility into:

- New booking cases
- Provider pending cases
- Provider rejected cases

- No-response cases
- Cases requiring customer calling
- Reschedule cases
- Confirmed appointments
- Completed appointments
- Closed cases

Without this, agents would have to manually track service status and follow up through disconnected communication channels.

8.3 Provider-Side Discovery

Providers were a critical dependency in the fulfilment journey. Provider responses could include accepting an appointment, rejecting an appointment, suggesting an alternate slot, or not responding within the defined TAT. Each response required a different system action and customer communication.

8.4 Operations-Side Discovery

Operations teams needed a TAT-driven view of fulfilment performance. They needed to know:

- Which cases were pending provider response?
- Which cases had breached TAT?
- Which providers were not responding?
- Which cases needed manual intervention?
- Which cases had been confirmed but not completed?
- Which journeys were causing complaints?

9. Problem Statements

Problem Area	Problem Statement
Core Problem	BFHL customers needed reliable fulfilment assurance for lab test bookings and doctor appointments because booking creation alone did not guarantee provider confirmation, appointment completion, timely communication, app-visible status updates, or recovery from rejection/no-response cases, resulting in broken journeys, customer complaints, weak provider accountability, and manual operational follow-up.
Customer	Customers needed confidence and visibility after booking a lab test or doctor appointment because the service outcome depended on provider confirmation, appointment execution, reminders, and recovery from rejection or no-response scenarios.
Fulfilment Agent	Fulfilment agents needed structured SFDC queues, case states, provider response visibility, customer communication history, and escalation triggers because they were responsible for ensuring appointment fulfilment across multiple systems and communication channels.
Provider	Providers needed a clear confirmation and response mechanism because delayed acceptance, rejection, or no response directly affected fulfilment rate and customer trust.
Operations	Operations teams needed TAT-based visibility and fulfilment tracking because they had to manage provider accountability, SLA breaches, broken journeys, and complaint reduction.

10. As-Is Pain Points

Area	Pain Point
Booking Intake	Bookings needed to become operationally trackable fulfilment cases.
Provider Confirmation	Provider response was a critical dependency.
Rejection Handling	Provider rejection could break the customer journey.
No-Response Handling	Provider non-response needed escalation.
Customer Communication	Customers needed timely updates and reminders.
Status Visibility	Customer-facing app/web status visibility was required.
Agent Workflow	Agents needed actionable queues and next steps.
HRx-SFDC Sync	Booking and case status needed to remain aligned.
Escalation	TAT breaches needed structured escalation.
Service Closure	Case closure needed to reflect actual service outcome.

11. Design Thinking Process

11.1 Empathize

The project began by understanding the experience of customers, fulfilment agents, providers, and operations teams.

Perspective	Key Need
Customer	A customer's anxiety begins after booking, because booking does not equal fulfilment.
Agent	Do not make me manually chase every booking. Tell me which case needs action, why it needs action, and what I should do next.
Provider	Give me a clear way to accept, reject, or reschedule.
Operations	Give me visibility into fulfilment health, provider response, SLA breaches, and broken journeys.

11.2 Define

The problem was defined as a fulfilment assurance gap. The issue was not that customers could not book. The issue was that the post-booking journey lacked structured ownership, communication, and escalation.

- How do we ensure every booking becomes a trackable case?
- How do we track provider confirmation?
- How do we inform the customer at the right time?
- How do we escalate provider non-response?
- How do we recover rejected or rescheduled bookings?
- How do we ensure app-facing status visibility?
- How do we measure fulfilment success?

11.3 Ideate

Track	Purpose
SFDC Case Flow	Convert bookings into operational cases.
HRx Integration	Keep booking and case status synchronized.
Provider Confirmation Workflow	Track accept/reject/reschedule/no-response.
Agent Queue Management	Give agents actionable work buckets.
Communication Automation	Send WhatsApp, SMS, and voice-blast updates.

Track	Purpose
App-Facing Status Visibility	Keep customers informed.
TAT-Based Escalation	Prevent silent fulfilment failures.
Recovery Flows	Handle rejection, cancellation, and rescheduling.
Reporting	Track fulfilment rate and operational health.

11.4 Prototype and Product Definition

The solution was translated into user stories, action plans, SFDC case flows, HRx-SFDC integration requirements, communication triggers, provider confirmation states, customer status states, agent queues and views, escalation paths, booking recovery logic, and fulfilment closure rules.

The project was not built as an abstract workflow. It was built around actual operational states and user actions.

11.5 Deliver and Validate

The complete Service Guarantee flow went live. Delivered capabilities included lab test fulfilment workflow, doctor appointment fulfilment workflow, SFDC case management, HRx-SFDC integration, app-facing status visibility, provider confirmation tracking, agent case queues, WhatsApp communication, SMS communication, voice-blast automation, TAT/SLA-based escalation, and booking recovery flows.

ProviderRx was evaluated as a separate provider-side track but was deprioritized. This distinction is important because the core Service Guarantee flow went live without claiming ProviderRx as part of the final delivered scope.

12. Solution Architecture at Capability Level

12.1 SFDC Case Management Layer

Purpose: Convert every relevant booking into a trackable fulfilment case.

- Case creation from lab test booking
- Case creation from doctor appointment booking
- Customer details capture
- Appointment details capture
- Provider details capture
- Case ownership
- Case status tracking
- Closure logic

12.2 HRx-SFDC Integration Layer

Purpose: Keep fulfilment workflow and booking workflow aligned.

- HRx booking data sent to SFDC
- SFDC case status synced with HRx
- Appointment state changes reflected across systems
- App-facing status enabled through backend status updates
- Operational status and customer-facing status aligned

12.3 Provider Confirmation Layer

Purpose: Make provider response structured and measurable.

Provider Response	System Handling
Accepted	Move case toward appointment confirmation.

Provider Response	System Handling
Rejected	Trigger customer recovery path.
Reschedule suggested	Trigger customer reschedule flow.
No response	Trigger automated reminder, voice blast, escalation, or agent calling.

12.4 Agent Queue Layer

Purpose: Convert raw cases into actionable work buckets.

- New cases
- Cases requiring calling
- Processing by agent
- Provider requires calling
- Declined by provider
- Waiting for customer rescheduling
- No response from provider
- Confirmed by provider
- Confirmed by both customer and provider
- Appointment completed
- Case closed

12.5 Customer Communication Layer

Purpose: Reduce uncertainty through proactive communication.

- WhatsApp
- SMS
- Voice Blast

Journey Moment	Communication Purpose
Booking initiated	Acknowledge request.
Provider confirms	Confirm appointment.
Provider rejects	Inform customer and offer recovery path.
Reschedule needed	Coordinate alternate slot.
Before appointment	Send reminder.
Appointment nearing	Send final reminder or preparation instruction.
After appointment	Confirm service completion.
Report/status pending	Follow up and support closure.

12.6 TAT-Based Escalation Layer

Purpose: Prevent fulfilment cases from silently failing.

- Defined SLA/TAT for provider response and case movement
- Automated reminders
- Voice-blast escalation
- Agent queue movement
- Manual intervention trigger
- Unresolved case tracking
- Provider non-response visibility

12.7 Recovery Flow Layer

Purpose: Handle real-world service failures without breaking the customer journey.

- Provider rejects appointment
- Provider does not respond
- Provider suggests alternate slot
- Customer wants reschedule
- Customer wants cancellation
- Appointment requires manual follow-up
- Case needs escalation

13. Delivered Scope

Capability	Delivery Status
Lab test fulfilment flow	Went live
Doctor appointment fulfilment flow	Went live
SFDC case-management workflow	Went live
HRx-SFDC integration	Went live
App-facing status visibility	Went live
Provider confirmation workflow	Went live
WhatsApp communication automation	Went live
SMS communication automation	Went live
Voice-blast automation	Went live
TAT/SLA-based escalation	Went live
Booking recovery flows	Went live
ProviderRx provider-side track	Deprioritized

14. Business Impact

The project delivered a complete Service Guarantee flow and improved the fulfilment operating model for lab test bookings and doctor appointments.

- Complete Service Guarantee flow went live.
- Fulfilment Rate became the primary measure of success.
- App-facing status visibility went live.
- WhatsApp, SMS, and voice-blast automation went live.
- TAT/SLA-based escalation was introduced.
- Customer complaints reduced significantly.
- Customer trust improved.
- Provider accountability improved.

"Do not claim a specific complaint-reduction percentage unless a number is later available. Correct statement: customer complaints reduced significantly after the Service Guarantee flow went live."

15. Role and Ownership

As Lead Product Manager, Samadhan owned the full Service Guarantee initiative at BFHL in 2022.

- Owned the complete product solutioning.
- Led the project across lab test and doctor appointment fulfilment.
- Worked with junior PMs on user stories and action plans.
- Defined SFDC case-management flows.
- Owned HRx-SFDC integration requirements.
- Defined provider confirmation workflows.
- Defined customer communication workflows.
- Defined WhatsApp/SMS/voice-blast triggers.

- Defined app-facing status visibility.
- Defined TAT-based escalation.
- Defined booking recovery flows.
- Coordinated delivery until complete go-live.

16. Design Thinking-Led Product Narrative

Immediately after the BFHL OPD Reimbursement Claims Processing project, Samadhan led the Service Guarantee initiative in 2022. The objective was to improve fulfilment assurance for lab test bookings and doctor appointments.

The core insight was that customers did not simply need a booking. They needed confidence that the service would actually be fulfilled. Booking creation alone did not guarantee provider confirmation, appointment completion, reminders, app-visible status updates, or recovery from rejection and no-response cases.

Samadhan led the project as Lead Product Manager, supported by junior PMs. The team mapped the customer, provider, agent, operations, HRx, SFDC, and communication journeys. Based on this discovery, the project created an SFDC-led fulfilment workflow integrated with HRx, including provider confirmation states, app-facing status visibility, agent queues, automated WhatsApp/SMS/voice-blast communication, booking recovery flows, and TAT-based escalation.

The complete Service Guarantee flow went live. Fulfilment Rate was the primary success metric, with customer complaints reducing significantly after rollout. The project improved customer trust and created stronger provider accountability.

17. Portfolio Summary

"Led BFHL's 2022 Service Guarantee initiative for lab test and doctor appointment fulfilment, building an SFDC-led fulfilment assurance workflow integrated with HRx, app-facing status visibility, provider confirmation, WhatsApp/SMS/voice-blast automation, TAT-based escalation, and agent case queues. The complete flow went live, improved provider accountability, strengthened customer trust, and significantly reduced customer complaints."

18. Resume Bullet

Led BFHL's Service Guarantee product initiative for lab test and doctor appointment fulfilment, designing and delivering an SFDC-led fulfilment workflow integrated with HRx, provider confirmation, app-facing status visibility, automated WhatsApp/SMS/voice-blast communication, and TAT-based escalation; improved fulfilment governance, provider accountability, customer trust, and significantly reduced customer complaints.

19. Final One-Line Framing

"Service Guarantee transformed BFHL's lab test and doctor appointment journey from a booking-led process into a fulfilment-assurance operating model with system-led tracking, provider accountability, proactive customer communication, TAT-based escalation, and app-visible service status."
