

HighRadius Autonomous Collections

Design Thinking-Led Product Case Study

Case study positioning

This document is built using public HighRadius product information and the user-confirmed role context: Senior Product Manager for HighRadius Autonomous Collections / Order-to-Cash during 11/2021-06/2022. Public product terminology has evolved; the case study separates current public positioning from the 2021-2022 product contribution context.

Attribute	Detail
Company	HighRadius
Product area	Autonomous Receivables - Collections Management / Autonomous Collections
Role	Senior Product Manager
Timeline	November 2021 to June 2022
Location	Gurugram, India
Product category	B2B SaaS for enterprise Accounts Receivable / Order-to-Cash teams
Primary users	Collectors, AR managers, credit/collections leaders, shared-service teams, Office of the CFO stakeholders
Core outcomes	Lower past-due balances, improved collector productivity, better cash-flow predictability, higher collections coverage, lower manual effort

1. Executive Summary

HighRadius Autonomous Collections is part of the broader HighRadius Autonomous Receivables / Order-to-Cash ecosystem. Public product material positions Collections Management as an AI-powered collections platform that helps finance teams prioritize the right accounts, automate outreach, streamline AP portal work, improve collector productivity, and reduce past-due receivables.

As Senior Product Manager, Samadhan worked in the Collections / Autonomous Collections area, contributing to product capabilities such as AI-driven worklist prioritization, automated dunning and payment reminders, AR email inbox classification and draft responses, AP portal invoice upload and tracking, collector workbench workflows, dispute-prevention signals, and ERP-integrated collections execution.

The design-thinking story is not merely "collections automation." The deeper product problem was that enterprise collectors were spending too much time discovering what to work on, manually checking portals, sending repetitive reminders, handling fragmented emails, and switching between ERP, inbox, customer portals, spreadsheets, and collections systems. The product direction was to transform collections from a reactive, aging-report-driven process into an intelligence-led, prioritized, automated, and measurable operating model.

2. Public Product Context

HighRadius publicly describes its Collections Software as using AI agents to prioritize the right accounts and automate outreach to accelerate cash flow and reduce DSO. It also publicly states business-value claims such as reducing past dues and improving collector productivity. The current public product language includes "Agentic AI"; the case study uses this only as current-market context, while the user role period is framed as Autonomous Collections / Autonomous Receivables.

Public product capability	Product implication
AI-prioritized worklists	Move collectors from static aging reports to risk/impact-based daily action queues.
Automated dunning and outreach	Scale follow-up coverage for long-tail customers without proportional headcount growth.
AP portal invoice upload and tracking	Reduce manual login/upload/status-check effort across customer AP portals.
AR email inbox / auto-response	Classify incoming AR emails, summarize threads, and draft standard responses.
Parallel dialer / in-app calling	Increase customer contact coverage and keep activity history inside the collections workflow.
ERP integrations	Connect collections workflows with enterprise finance systems such as SAP, NetSuite, Microsoft Dynamics, and Sage Intacct.
Dashboards and reports	Give managers visibility into collector productivity, past-due coverage, DSO, and process health.

3. Design Thinking Reframe

Weak framing: "Build a collections automation tool."

Stronger framing: "Help enterprise AR teams know whom to contact, when to contact them, what to say, which invoice or dispute evidence matters, and which actions can be automated safely."

Core insight

Collections teams do not only need a system of record. They need a system of prioritized action. The product had to reduce decision fatigue, manual portal work, repetitive communication, and fragmented follow-up while preserving collector judgment for complex customer relationships.

4. Primary User Personas

Persona	Jobs to be Done	Pain Points
Collector	Recover overdue receivables, follow up with customers, track promises-to-pay, resolve disputes, maintain relationships.	Static aging reports, manual prioritization, inbox overload, repetitive outreach, portal logins, scattered notes.
Collections Manager	Improve team productivity, reduce DSO/past due, monitor coverage and collector performance.	Limited real-time visibility, inconsistent strategies, manual reporting, portfolio imbalance.
AR Shared Services Leader	Standardize global collections operations and improve scale across regions/entities.	Regional process variation, ERP fragmentation, manual exceptions, difficulty proving ROI.
Customer / AP Contact	Receive invoices, clarify disputes, commit payment date, complete payment with minimal friction.	Repeated follow-ups, missing invoice copies, unclear dispute status, no simple payment path.
IT / Finance Systems Team	Integrate collections workflows with ERP, email, customer portals, and data pipelines.	Custom integrations, portal variability, access/security, data quality and operational continuity.

5. Problem Statements

Enterprise AR collectors needed an intelligent daily workbench because static aging reports and manual prioritization did not tell them which customers required immediate action, resulting in lower coverage, missed high-risk accounts, and inefficient collection effort.

Collectors needed automated outreach and dunning because repetitive reminders, invoice copies, promise-to-pay follow-ups, and payment nudges consumed time that should be used for high-value negotiation and dispute resolution.

Collections teams needed AP portal automation because large customers often required invoice upload, status tracking, and dispute/P2P monitoring inside customer portals, creating heavy manual effort and delayed visibility.

AR teams needed an intelligent inbox because customer emails related to invoice copies, payment promises, disputes, remittances, and clarifications were mixed with non-collection emails, causing slow response and missed context.

Managers needed operational dashboards because productivity, coverage, past-due risk, outreach effectiveness, and collector performance were difficult to track through ERP data alone.

6. As-Is Journey Diagnosis

As-Is Step	User Friction	Product Opportunity
Download / inspect aging report	Collector manually identifies accounts to chase.	AI-prioritized worklist based on risk, amount, behavior, and urgency.
Open ERP/customer record	Context spread across ERP, notes, invoices, disputes, and emails.	Collector workbench with customer 360 and invoice-level context.
Check AP portal	Manual login and status tracking across many external portals.	AP portal upload and invoice-status tracking automation.
Send reminder/dunning email	Repetitive templates and manual personalization.	Automated dunning and personalized outbound email drafts.
Read incoming emails	Inbox overload and context switching.	AR email inbox classification, summarization, and draft responses.
Call customer	Manual dialing and activity logging.	In-app calling, parallel dialer, auto activity capture.
Update notes / P2P / dispute flags	Manual updates and inconsistent follow-through.	Auto-logged P2Ps, dispute flags, next-best actions, workflow triggers.
Report progress to manager	Manual reports and inconsistent metrics.	Dashboards for coverage, productivity, DSO/past-due movement.

7. Solution Tracks

7.1 AI-Driven Worklist Prioritization

Purpose: Give collectors a ranked daily action list instead of asking them to interpret static aging reports. The worklist should balance past-due amount, payment behavior, credit risk, payment likelihood, days late, dispute indicators, and collector capacity.

- Prioritized account and invoice queues
- Suggested next action: call, email, payment reminder, dispute follow-up, portal check
- Risk and urgency signals surfaced at account/invoice level
- Balanced workloads across collector portfolios
- Manager visibility into coverage and follow-up completion

7.2 Automated Dunning and Payment Reminder Strategy

Purpose: Scale outreach for long-tail customers while preserving collector time for complex, high-value accounts.

- Rule-based and AI-assisted reminder sequences
- Personalized email templates based on invoice, customer, and payment status
- Payment links embedded in outreach where supported
- Automated follow-up for payment commitments and missed promises
- Coverage tracking across portfolios

7.3 AR Email Inbox and Auto-Response

Purpose: Reduce inbox fragmentation by bringing AR communication into the collections workbench.

- Customer identification from sender/content
- Email categorization: invoice copy, payment commitment, dispute, clarification, remittance, non-collections
- Thread summarization for faster context recovery
- Draft responses for standard customer requests
- Linking email context to customer/invoice records

7.4 AP Portal Invoice Upload and Tracking

Purpose: Reduce manual work for large customers whose AP processes require portal submission and status checks.

- Identify invoices requiring AP portal submission
- Upload invoices and supporting documents to customer portals
- Track invoice status and payment milestones
- Capture P2P/dispute signals from portal updates
- Trigger follow-up workflows when status changes

7.5 Collector Workbench and Customer 360

Purpose: Give collectors a single execution environment for account context, invoice context, email, calls, disputes, payment commitments, notes, and next-best actions.

- Customer-level and invoice-level visibility
- Activity history across calls/emails/notes
- Promise-to-pay and dispute tracking
- ERP-linked customer/account data
- Manager dashboards for productivity and coverage

8. Senior PM Contribution Map

The following contribution map is based on user-confirmed career context and aligned with public HighRadius product capability areas. It should be refined further if exact module ownership, release names, or customer-specific metrics are available.

Contribution Area	Senior PM Responsibility
Discovery and workflow analysis	Understand collector workflows, pain points, account prioritization logic, dunning flows, inbox behavior, AP portal dependencies, and ERP integration requirements.
AI worklist prioritization	Define user stories and acceptance criteria for prioritized collector queues, ranking signals, next-best actions, and manager visibility.
Automated dunning/payment reminders	Shape outreach strategy, template logic, triggers, payment commitment follow-up, and coverage tracking.
AR email inbox / draft responses	Define categorization, customer matching, thread summary, response drafting, and linking communication to AR records.
AP portal upload and tracking	Translate portal-driven enterprise customer workflows into upload, tracking, status capture, and exception-handling requirements.
Dispute-prevention flags	Surface invoice, portal, email, or payment-status signals that indicate risk of delayed payment or dispute.
Collector workbench	Consolidate account context, activities, next actions, emails, notes, P2P, disputes, and dashboards into execution workflows.
ERP integrations	Collaborate with engineering, implementation, and customers around SAP, Oracle NetSuite, Microsoft Dynamics, Sage Intacct, and related system context.

9. Metrics and Impact Model

Public HighRadius materials state product-value outcomes including reduced past dues, improved collector productivity, increased collection call/email coverage, and increased automated email outreach. These should be used carefully as product-value positioning unless tied to a specific customer implementation that the user can verify.

Metric Area	Why It Matters	How Product Influences It
Past-due reduction	Core business outcome for AR leaders.	Prioritized worklists, automated outreach, portal tracking, and dispute prevention.
Collector productivity	Measures output per collector and ability to scale.	Automation of repetitive email, portal, note-taking, and prioritization tasks.
DSO / cash conversion	Measures speed of receivables conversion.	Earlier follow-up, payment links, better coverage, and dispute visibility.
Collections coverage	Measures how many customers/accounts are touched.	Automated long-tail dunning and prioritized daily worklists.
Call/email throughput	Measures operational execution capacity.	Parallel dialer, email templates, auto-response, and workflow triggers.
Manual effort reduction	Measures automation ROI.	AP portal automation, inbox classification, dunning automation, and ERP-integrated workbench.

Metric caution

Do not present public HighRadius product metrics as personal project outcomes unless the user can tie them to a specific release/customer/program. The safest phrasing is: "The product value proposition targeted outcomes such as reduced past dues, higher collector productivity, better coverage, and faster receivables conversion."

10. Design Thinking Process

Stage	Application to Autonomous Collections
Empathize	Study collector day-in-the-life: aging reports, customer prioritization, AP portal checks, dunning emails, calls, disputes, inbox triage, and ERP updates.
Define	Frame the problem as action prioritization, communication automation, portal automation, and collector productivity - not

	only collections reporting.
Ideate	Explore solution tracks: AI worklist, automated dunning, AR inbox, AP portal automation, in-app calling, dispute flags, manager dashboards.
Prototype	Convert workflows into user stories, wireframes, ranking logic, notification states, email templates, dashboard views, and exception paths.
Validate	Test whether collectors can identify the right account faster, send more relevant outreach, reduce manual portal checks, and improve follow-up coverage.
Scale	Support ERP integration, customer-specific configuration, global portfolios, and standardized collections operating models.

11. Product Architecture View

Layer	Capabilities
Data ingestion and integration	ERP invoices, customer master, open AR, payment status, disputes, promises-to-pay, emails, AP portal statuses, activity history.
Intelligence layer	Payment-risk signals, delinquency prediction, account prioritization, suggested next action, dispute risk, communication classification.
Automation layer	Dunning sequences, invoice upload, portal status tracking, email classification, draft response, payment reminders, workflow triggers.
Collector experience layer	Daily worklist, customer 360, invoice detail, email inbox, in-app calling, activity logging, notes, dispute/P2P management.
Manager and control layer	Dashboards, coverage tracking, productivity, portfolio health, past-due movement, escalation views, process compliance.

12. Business Narrative

HighRadius Autonomous Collections addressed a high-value enterprise finance problem: collections teams were expected to reduce past dues and improve cash flow, but their daily execution was often fragmented across static aging reports, ERP records, spreadsheets, customer AP portals, emails, phone calls, and manual notes.

The product direction shifted collections from reactive follow-up to proactive, data-driven action. AI-prioritized worklists helped collectors focus on the right accounts; automated dunning expanded customer coverage; AP portal automation reduced manual login loops; AR email inbox capabilities reduced communication fragmentation; and dashboards helped managers track performance and process health.

As Senior Product Manager, Samadhan worked on product capabilities that sat at the intersection of enterprise finance workflows, collector productivity, AI-assisted prioritization, automation, and ERP-integrated execution. This experience is particularly relevant to later product work in healthcare claims, payer-provider operations, and AI-led workflow transformation because the underlying product pattern is similar: convert fragmented manual operations into prioritized, auditable, workflow-led systems.

13. Interview-Ready Story

At HighRadius, I worked as Senior Product Manager on the Autonomous Collections product within the Order-to-Cash / Autonomous Receivables suite. The product served enterprise AR and collections teams that needed to reduce past-due balances, improve collector productivity, and accelerate cash conversion.

The core product insight was that collectors were not only struggling with follow-up execution; they were struggling with knowing where to focus. Static aging reports did not tell them which accounts had the highest risk, which customers were likely to pay, which invoices were stuck in AP portals, or which incoming emails required urgent action.

My work mapped to capabilities such as AI-driven worklist prioritization, automated dunning and payment reminders, AR email inbox classification and draft responses, AP portal invoice upload and tracking, collector workbench workflows, dispute-prevention signals, and ERP-integrated collections execution. The product helped transform collections from reactive account chasing into an intelligence-led operating model with prioritization, automation, and measurable productivity gains.

14. Resume Bullet Options

- **Option 1 - Balanced:** Senior PM for HighRadius Autonomous Collections, contributing to AI-prioritized worklists, automated dunning, AR email inbox workflows, AP portal invoice upload/tracking, and ERP-integrated collector workbench capabilities for enterprise Order-to-Cash teams.
- **Option 2 - Outcome-led:** Drove product capabilities for HighRadius Autonomous Collections to improve collector productivity, collections coverage, past-due recovery, and AR process automation through AI-based prioritization, dunning automation, AP portal tracking, and intelligent inbox workflows.
- **Option 3 - AI/workflow-led:** Built AI-assisted collections workflow capabilities including prioritized collector queues, automated outreach, email classification/draft responses, AP portal automation, and dispute-risk flags, helping enterprise AR teams move from static aging reports to action-led collections execution.

15. Source-Backed Product Notes

The following public sources were used for product context. They describe HighRadius product capabilities and current public positioning; they do not by themselves prove the user's individual ownership.

Source	What it supports
HighRadius Collections Software	AI agents for collections, account prioritization, automated outreach, AP portal invoice upload/tracking, automated dunning, KPI claims, ERP integrations.
HighRadius Collections Management with Agentic AI	Portal automation, AP portal tasks, SMB outreach, frictionless payments, smart dunning, predictive outreach, large-account and SMB collections patterns.
HighRadius Demo Center - Collections Management	Delinquency prediction, in-app calling, automated dunning, email drafting, productivity positioning.
HighRadius AI-Powered Worklist Prioritization	Definition of collections worklist prioritization and why prioritized queues improve recovery focus.
Microsoft Marketplace - HighRadius Autonomous Receivables Suite	Autonomous Receivables modules: Credit, EIPP, Cash Application, Deduction Management, Collections Management; Collections capabilities such as worklist prioritization, automated dunning, dispute management.
HighRadius AR Email Inbox	Customer identification, email categorization, thread summarization, and draft response capabilities.
